

Connecting Healthcare Evidence to Better Decisions.

THE PROJECT

A functional AI healthcare growth analysis and evaluation system built to examine evidence across an organization, connect what different departments are seeing, and identify where human judgment should be focused.

OBSERVED FINDING

≈\$251K

An estimated \$251,000 in additional collection opportunities if out-of-network claims had realized at the in-network rate.

01 BENCHMARK RESULTS

MISS / MISS

02 CONTROL RESULT

CLEAN

Together, the results showed both current capability and where refinement is needed: a financially meaningful observed finding, two benchmark misses, and a clean control under frozen evaluation criteria.

Building Toward Predictable Growth

Better-connected evidence can improve attribution, help identify where growth is breaking down, focus human judgment on the right problem, and make it possible to measure what changes.

MODEL → CONNECT → TEST → REFINE → FOCUS JUDGMENT

Built and evaluated using Harbor Ridge, a controlled synthetic operating environment.
